#### Abstract

The energy $E$ of a graph is defined as the sum of the absolute values of its eigenvalues. A graph with $n$ vertices is said to be hypoenergetic if $E<n$. Li and Ma $[\mathrm{X} . \mathrm{Li}, \mathrm{H}$. Ma, Hypoenergetic and strongly hypoenergetic $k$-cyclic graphs, MATCH Commun. Math. Comput. Chem. 64 (2010) 41-60] studied hypoenergetic $k$-cyclic graphs. They showed that there exist hypoenergetic unicyclic, bicyclic, and tricyclic graphs for all $n$ and the maximum degree $\Delta \geq 4$, except in the following cases of $\Delta=4$, for which they did not determine whether or not there exist hypoenergetic graphs: (i) $n=13$ for unicyclic graphs; (ii) $n=8,10,11,12,14,15$ for bicyclic graphs and (iii) $n=8,9,11,12,15$ for tricyclic graphs. In this paper, we complete the solution of these problems, and show that there are no hypoenergetic graphs for all these cases.

[^0]Let $G$ be a simple graph with $n$ vertices, and let $\lambda_{1}, \lambda_{2}, \ldots, \lambda_{n}$ be the eigenvalues of its adjacency matrix. The energy of a graph $G$ is defined as $E(G)=\left|\lambda_{1}\right|+\left|\lambda_{2}\right|+$ $\cdots+\left|\lambda_{n}\right|$. For more information on the energy of graphs, we refer to [1]. Recently, it has been demonstrated [2] that the energy exceeds the number of vertices for several classes of graphs, and a result of Nikiforov [3] showed that the number of graphs satisfying the condition $E<n$ is relatively small. Thus it is feasible to find them. In [4] a hypoenergetic graph is defined to be a graph satisfying $E<n$. Some results on hypoenergetic graphs were studied in [4-9].

In [9] Li and Ma showed that there exist hypoenergetic unicyclic, bicyclic, and tricyclic graphs for all $n$ and the maximum vertex degree $\Delta \geq 4$, except in the following cases of $\Delta=4$, for which they do not determine whether or not there exist hypoenergetic graphs: (i) $n=13$ for unicyclic graphs; (ii) $n=8,10,11,12,14,15$ for bicyclic graphs and (iii) $n=8,9,11,12,15$ for tricyclic graphs. In this note, we complete the solution of these problems, and show that there are no hypoenergetic graphs for all these cases.

Lemma [5]. Let $G$ be a graph with $n$ vertices and $m$ edges, possessing $q$ quadrangles, and let $d_{1}, d_{2}, \ldots, d_{n}$ be its vertex degrees. If

$$
\sqrt{\frac{8 m^{3}}{\sum_{i=1}^{n} d_{i}^{2}-2 m+8 q}} \geq n
$$

then $G$ is non-hypoenergetic.
Theorem. A $k$-cyclic graph $G$ with $n$ vertices and maximum vertex degree $\Delta=4$, which satisfies one of the following conditions is non-hypoenergetic:
(I) $k=1$ and $n=13$;
(II) $k=2$ and $n=8,10,11,12,14,15$;
(III) $k=3$ and $n=8,9,11,12,15$.

Proof. Let $n_{1}, n_{2}, n_{3}, n_{4}$ be the number of vertices with degrees $1,2,3,4$ in $G$, respectively. $n_{4} \geq 1$ since $\Delta=4$. Let

$$
N=\sqrt{\frac{8 m^{3}}{\sum_{i=1}^{n} d_{i}^{2}-2 m+8 q}}
$$

where $m$ is the number of edges, $q$ is the number of quadrangles, and $d_{1}, d_{2}, \ldots, d_{n}$ are its vertex degrees.

By Lemma, we only need to prove that $N \geq n$ for the graph $G$.
(I) $k=1$. Note that $0 \leq q \leq 1$ in any unicyclic graph.

If $n=13$, then $m=n=13$ and

$$
\left\{\begin{array}{l}
n_{1}+n_{2}+n_{3}+n_{4}=13 \\
n_{1}+2 n_{2}+3 n_{3}+4 n_{4}=26
\end{array}\right.
$$

We have $n_{2}+2 n_{3}+3 n_{4}=13$, and $1 \leq n_{4} \leq 4$. All the solutions of $n_{1}, n_{2}, n_{3}, n_{4}$ are shown in Table 1.

Table 1.

| $n_{4}$ | 1 | 1 | 1 | 1 | 1 | 1 | 2 | 2 | 2 | 2 | 3 | 3 | 3 | 4 |

It follows that $N \geq \sqrt{\frac{8 m^{3}}{76-2 m+8}}>17>n$.
(II) $k=2$. Note that $0 \leq q \leq 3$ in any bicyclic graph.
(i) If $n=8$, then $m=n+1=9$ and

$$
\left\{\begin{array}{l}
n_{1}+n_{2}+n_{3}+n_{4}=8 \\
n_{1}+2 n_{2}+3 n_{3}+4 n_{4}=18 .
\end{array}\right.
$$

We have $n_{2}+2 n_{3}+3 n_{4}=10$, and $1 \leq n_{4} \leq 3$. All the solutions of $n_{1}, n_{2}, n_{3}, n_{4}$ are shown in Table 2.

It follows that $N \geq \sqrt{\frac{8 m^{3}}{56-2 m+24}}>9>n$.
(ii) If $n=10$, then $m=n+1=11$ and

$$
\left\{\begin{array}{l}
n_{1}+n_{2}+n_{3}+n_{4}=10 \\
n_{1}+2 n_{2}+3 n_{3}+4 n_{4}=22
\end{array}\right.
$$

We have $n_{2}+2 n_{3}+3 n_{4}=12$, and $1 \leq n_{4} \leq 4$. All the solutions of $n_{1}, n_{2}, n_{3}, n_{4}$ are shown in Table 3.

It follows that $N \geq \sqrt{\frac{8 m^{3}}{70-2 m+24}}>12>n$.
(iii) If $n=11$, then $m=n+1=12$ and

$$
\left\{\begin{array}{l}
n_{1}+n_{2}+n_{3}+n_{4}=11 \\
n_{1}+2 n_{2}+3 n_{3}+4 n_{4}=24
\end{array}\right.
$$

We have $n_{2}+2 n_{3}+3 n_{4}=13$, and $1 \leq n_{4} \leq 4$. All the solutions of $n_{1}, n_{2}, n_{3}, n_{4}$ are shown in Table 4.
